

Airspace Technology Demonstration 2 (ATD-2) Prescheduling with EOBT's September 4, 2019

Al Capps Bob Staudenmeier

Pre-Scheduling with EOBT out of CLT

- Flights out of CLT that are scheduled with TBFM are subject to Approval Request (APREQ, also known as Call For Release)
 - About 1 in 10 flights that depart CLT are subject to APREQ
 - Other facilities, like SFO, have similar percentages
- TFDM has a plan to use the Earliest OFF Block Times provided by Operators plus new scheduling automation to secure a slot in TBFM at a set time prior to departure
 - ATD-2 has implemented this logic (plus a few additional features) and has been running this for all flights from CLT to ATL since Oct 2018 and to ORD since late June 2019
- Pre-scheduling with EOBT has gone well at CLT, and led to improved predictability (reduced variation)
 - At the same time, departure compliance to APREQ has risen. This helps the downstream facilities being scheduled into achieve a more stable schedule.

Pre-Scheduling with EOBTs (Started in Oct 2018)

3

NEO8SM LIN

Current Pre-Scheduling Logic in ATD-2 Leverages TBFM, SWIM and ATD-2

- 1) ATD-2 utilizes the Earliest Off Block Time (EOBT) data from Operators, an adapted buffer, and the predicted surface taxi time to generate an Earliest Feasible Takeoff Time (EFTT)
- 2) ATD-2 automatically send an APREQ release request to the appropriate Center TMC at an adapted time period prior to departure (currently 20 minutes prior to best estimate of pushback)
- 3) TFBM allows Center TMCs to respond to the release request just like it came from a native FAA IDAC system (i.e. no new training required)
- 4) SWIM provides the release time to the ATD-2 system, which in turn provides it to the ATC controller's flight strips, ramp controllers display, and SWIM TTP
- 5) Using ATD-2, CLT ATCT and ramp monitors progress toward the release time using agreed upon local procedures
- 6) <If necessary> ATD-2, TBFM and SWIM are used for re-planning the APREQ
- 7) ATD-2 captures data at each step for detailed measurement and analysis

2 Important Note on Buffer Time Calculation

- An important topic with pre-scheduling is the process used by the ATD-2 system to determine the earliest feasible takeoff time (EFTT) buffer size
- ATD-2 has two buffers that are relevant, EFTT and Controlled Time of Departure (CTD)
- EFTT Buffer
 - A statically adapted value that is added to the system's estimate of takeoff.
 - The EFTT does not include surface metering delay, but does account for some congestion that may prevent the flight from reaching the runway. The idea is not to 'double delay' the flight but also to provide a realistic OFF time into TBFM.
 - ATD-2 uses a 1 minute buffer for flights with EOBTs, and a 4 minute buffer for flights that have no EOBT
 - These buffers are necessary to ensure high compliance with earlier scheduling
- CTD Buffer
 - Used to help ensure flights to push back early/on-time to meet the APREQ
 - This value is the same for all Operators and independent of EOBT submission or not
 - Example: the system expects the pushback need to be at 12:10, but 12:04 is given as guidance to ramp personnel (and verbally to pilot, electronically in SWIM TTP)

- Lower and/or more predicable TBFM assigned delay
 - Allows continuation of pre-scheduling process while making progress toward the end state FAA and Industry plan
- Preparation for TFDM
 - Allows Operators time to calibrate EOBTs and operations ahead of TFDM deployment. Note: the resulting APREQ times are available to Operators on the TFDM Terminal Publication (TTP) SWIM feed
- Simplified Center operations
 - Reduces the need to manually enter times from surface into TBFM
 - Allows ZTL to delegate pre-scheduling monitoring functions to the site
- Greater Operator support in meeting release times
 - Allows ramp and pilots to help ATCT in the conformance to the controlled OFF time
- Metrics for Data-Driven Analysis and Improvement
 - Each steps of the scheduling process is captured in a highly instrumented system that can be used to analyze and improve the process.

The Ramp View

- If everyone is prescheduled does it become ineffective?
- "End of the line" prescheduling
 - CLT is the furthest airport away scheduling to the northeast
 - Goldilocks Principle
- Inaccurate EOBT's can "waste" slots in the overhead stream
 - This can be a problem for a normal APREQ but will be magnified in prescheduling
 - Encourage ALL to file accurate EOBT's

APREQ Delay For Flights into KATL

Continuing the trend in improvements for predictability of delay over last 7.5 months. (July 2019 only includes data up to the 15th).

APREQ Delay For Flights into KORD

Improvement over the last 2.5 months in delay estimate.

• Backup

3.2.2.2.4 Release Times

- 3.2.2.2.4.1 The TFDM System must [SSD918] enable one of the following modes per Call for Release (CFR) program of requesting release times for flights subject to a call for release based on user input:
 - a. Automatic Mode
 - b. Manual Mode
- 3.2.2.4.2 When in Automatic mode, the TFDM System must [SSD921] send a release time request:
 - a. For a flight that is within an a <u>user-entered lead time</u> of a user-entered departure parameter as defined in adaptation or,
 - b. Based on EFS Movement as defined in adaptation or,
 - c. For an adapted change in flight state
- 3.2.2.4.3 For a Configuration A ATCT TFDM site, when in Automatic mode, the TFDM System **must [SSD10497]** calculate the release time request to be the:
 - a. Earliest Feasible Take Off Time (EFTT) plus the CTD buffer, if the flight is not subject to a TMI
 - b. The latter of the Expect Departure Clearance Time (EDCT) and EFTT, if the flight is subject to a TMI and has an EDCT

Above are a some of the pre-scheduling requirements from the TFDM SSD. ATD-2 seeks to evaluate and mature these requirements at CLT.

EOBT Compliance

APREQ Reschedule
