

ATD-2 Perspective: SWIFT Day 2 Introduction

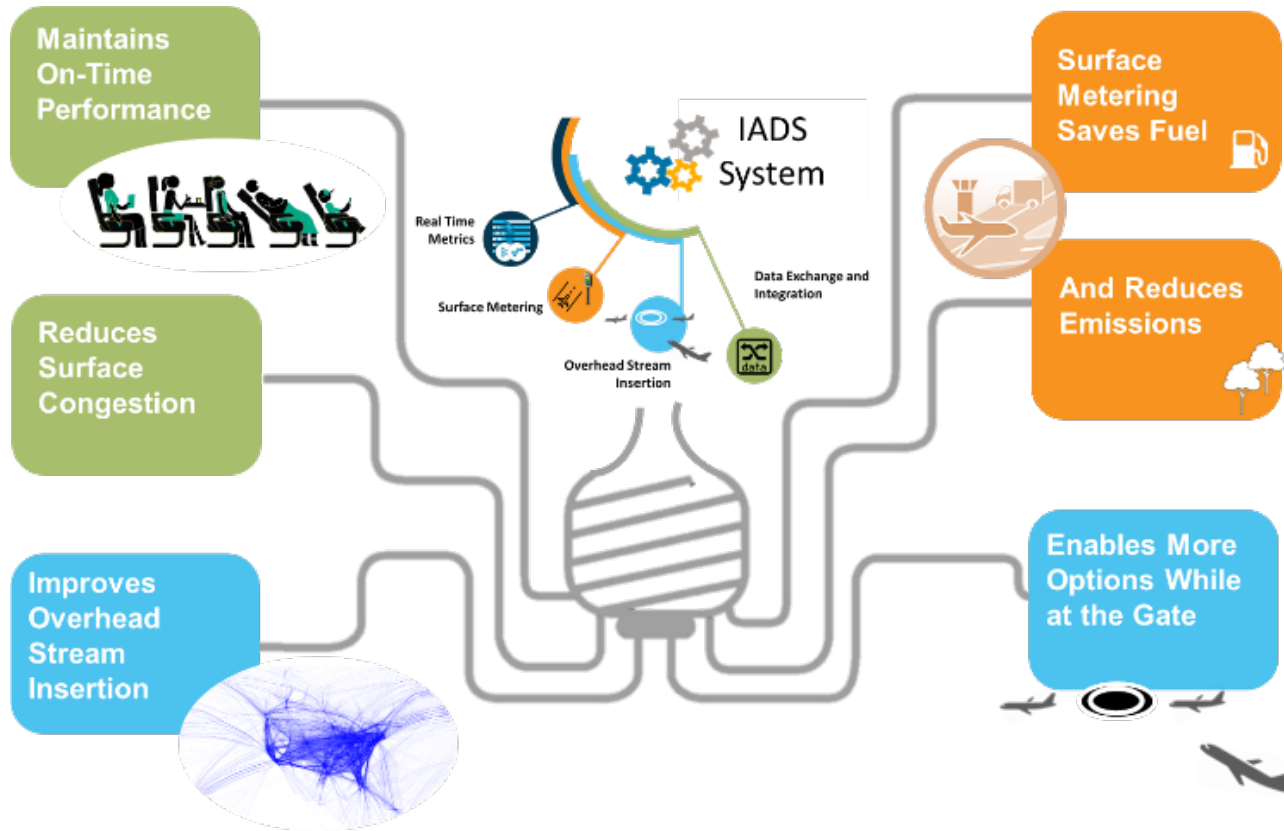

May 22, 2019

- ATD-2 has greatly benefited from existing SWIM feeds
 - The project is powered by real-time SWIM data 
- ATD-2 consumes and utilizes the following SWIM feeds in real-time
 - (TFMS) Traffic Flow Management System - Flight & Flow data
 - (STDDS) SWIM Terminal Data Distribution System
 - (SFDPS) SWIM Flight Data Publication Service
 - (TBFM) Time Based Flow Management
 - (TFDM) Terminal Flight Data Management
 - (TAIS) Terminal Automation Information Service
- ATD-2 produces the following real-time SWIM feed on SWIM R&D
 - TFDM Terminal Publication (TTP)
 - This is in close coordination with the TFDM PO, using same JMSDD
 - The desire is to foster industry **innovation** in preparation for TFDM.

ATD-2 Provides a Unique Vantage Point into the Potential Future NAS

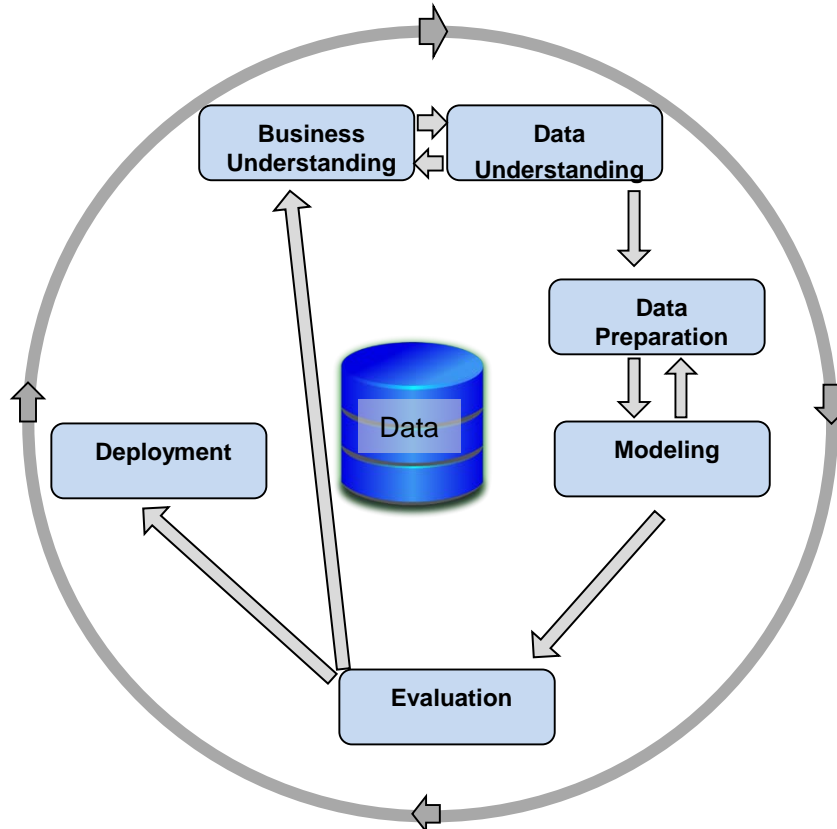

- Multiple benefits mechanisms (benefits through 2019-05-06)
 - 2,295,383 lbs. of fuel saved
 - CO₂ savings equivalent to 82,226 urban trees
 - 270.7 hours of surface delay saved
 - \$1,299,413 passenger value of time
 - \$368,206 flight crew costs
 - 1,777 hours of reduced runtime on engines

- Many people have worked hard to make SWIM data available (***Thank you!***)
 - Making the data available in a secure, stable platform was a major aviation engineering feat!
- Pre-processing & merging SWIM flight data feeds can be difficult, expensive and error prone
 - FAA decision support systems have valuable output data, but can provide inconsistent information on the same flight that is difficult for consumers to understand
 - Without deep knowledge of the underlying 3T (TFMS, TBFM, TFDM - plus ERAM and STARS) systems, the consumption logic may not lead toward the benefit the community desires
 - If everyone in the aviation industry creates their own SWIM flight data fusion process, many different organizations could come up with different definitions of the 'truth', degrading communication
- The ATD-2 mission required swift progress in field (operational) demonstrations
 - This led to a significant investment in logic that could address SWIM flight data pre-processing and mediation complexities. Much of this work is embodied in the 'Fuser' service.
 - Additional analytical investment was made in post-processing, which evolved over time through an ATD-2 internal data governance process with a feedback loop into the Fuser for more data
- ATD-2 desires to transfer this logic, lessons learned and software (if applicable)
 - After numerous conversations with Industry and FAA, this 'transfer' process is unclear
 - We welcome feedback from you to determine where any additional investments may be warranted
 - The goal is to create the basis for more advanced analytics, which builds upon mediated flight data

- The image above illustrates the Cross-industry standard process for data mining, known as **CRISP-DM**. This is an open standard process model that describes common approaches used by data mining experts. It is likely the most widely-used analytics model.
- Experts in data mining widely recognize the iterative nature of this process, as well as the need for periodic engagement between business and technical contributors
